If there is a 'seed_sequence' column, you can extract seed sequence in a separated FASTA file.

Execute

What it does

Converts a TSV file in BIOM file.

Inputs

Abundance file:
The abundance of each cluster in each sample (format TSV).
Authorized column names : rdp_tax_and_bootstrap, blast_taxonomy, blast_subject, blast_perc_identity, blast_perc_query_coverage, blast_evalue, blast_aln_length, seed_id, seed_sequence, observation_name, observation_sum

Multiple affiliation file:
Which stores the multiple blast hits.

Outputs

Abundance file:
The abundance of each cluster in each sample and theirs metadata (format [BIOM](#)).

Sequence file [optional]:
By checking the "Extract seed FASTA file" option, the sequences will be extract from TSV to [FASTA](#) format.
Be sure that your TSV file contains the seed_sequence column.

How it works

FROGS TSV to Biom will search any metadata (columns before "observation_name") and sample names (columns after "observation_sum").
Then it will reconstruct the Biom abundance file : for each "observation_name" it will add the associated metadata and the samples count.
If metadata include blast_taxonomy, and if blast_subject is equal to "multi-subject", it will parse de multi-hit TSV file, and extract the list of blast affiliations that contain the non-ambiguous blast taxonomy.

The screenshot shows the homepage of the Phylogeny.fr website. At the top left is the LIRMM logo with the text "Methodes et Algorithmes pour la Bio-informatique". At the top right is a banner for "Information Genomique et Structurale". A navigation bar contains links for Home, Phylogeny Analysis, Blast: Sequence Explorer, Online Programs, Your Workspace, Documentation, Downloads, and Contacts. The main heading reads "Please fill this survey (<5mn) Phylogeny.fr Robust Phylogenetic Analysis For The Non-Specialist". Below this is a blue teapot with a phylogenetic tree growing from its spout. A dashed box contains the following text: "Phylogeny.fr is a free, simple to use web service dedicated to reconstructing and analysing phylogenetic relationships between molecular sequences. Phylogeny.fr runs and connects various bioinformatics programs to reconstruct a robust phylogenetic tree from a set of sequences. If you use this site, please cite: Dereeper A.*, Guignon V.*, Blanc C., Audic S., Buffet S., Chevenet F., Dufayard J.F., Guindon S., Lefort V., Lescot M., Claverie J.M., Gascuel O. *Phylogeny.fr: robust phylogenetic analysis for the non-specialist*. Nucleic Acids Res. 2008 Jul 1;36(Web Server issue):W465-9. Epub 2008 Apr 19. (PubMed) *. joint first authors". Below this is a "Mirror site" link. At the bottom left, there are two main sections: "Phylogeny analysis" with sub-options "One Click", "Advanced", and "A la Carte", and "Explore your sequence neighbors".

Please fill this survey (<5mn)

"One Click" Mode

1. Overview 2. Data & Settings

Name of the analysis (optional):

Upload your set of sequences in FASTA, EMBL or NEXUS format from a file:

Aucun fichier sélectionné.

Or paste it here [\(load example of sequences\)](#)

Maximum number of sequences is 200 for proteins and 200 for nucleic acids.
Maximum length of sequences is 2000 for proteins and 6000 for nucleic acids.

[Names association](#)

Use the Gblocks program to eliminate poorly aligned positions and divergent regions
